Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) An integrated circuit comprising a processor, non-volatile memory, an input for receiving power from a power supply and a power detection unit, wherein the integrated circuit is configured to enable multi-word writes to the non-volatile memory, the processor being configured to:
control and trim the amount of power supplied to the input to predetermine a threshold at which operation of the integrated circuit is established; and
the power detection unit being configured to:
monitor a quality of power supplied to the input;
in the event the quality of the power drops below a ~~the~~ predetermined threshold, preventing subsequent words in any multi-word write currently being performed from being written to the memory.
2. (Previously Presented) The integrated circuit according to claim 1, further configured to prevent any further writes of any type to the memory once the quality is determined to have dropped below the threshold.
3. (Previously Presented) The integrated circuit according to claim 1, wherein the quality is a voltage.
4. (Previously Presented) The integrated circuit according to claim 1, wherein the memory is flash memory.
5. (Previously Presented) The integrated circuit according to claim 1, wherein the power detection unit is configured to provide a reset signal to at least some other circuits on the integrated circuit once any current writes have been finished.
